

19 39 2008 - BMW's GINA, Redefining One Shape Fits All

BMW's latest breakthrough highlights a proprietary design that frees the frame from the limits of steel - replacing it, instead, with a space-age material that allows the exterior of the car to remold itself in response to a variety of situations.

As if the mere existence of a functional vehicle with the ability to change itself on-the-fly isn't cool enough, BMW's engineering and design teams took their efforts one step further by integrating a number of potentially useful features into their highly conceptual design. Not only do the doors open in a similar fashion to moving a blanket, but the car's spoiler protrudes from the back of the car only at the speed at which the car's engineering team has determined its necessity. Unlike the myriad of other vehicles that possess this technology, the GINA is able to fluidly show and hide the spoiler

Though BMW's GINA may be one of the hottest models ever to roll off of their production line, the chances of seeing this vehicle in a showroom one day are rather slim - to say the least. It's far more
